UNITED NATIONS THE 2030 AGENDA FOR SUSTAINABLE DEVELOPMENT

TRANSFORMING OUR WORLD:

THE 2030 AGENDA FOR
SUSTAINABLE DEVELOPMENT

Se non si può
misurare qualcosa,
non si può migliorarla

LORD WILLIAM THOMSON KELVIN

15 indicatori a livello di Città

11.1.1 Proportion of urban population living in slums, informal settlements or inadequate housing

11.2.1 Proportion of population that has convenient access to public transport, by sex, age and persons with disabilities

11.3.1 Ratio of land consumption rate to population growth rate

11.3.2 Proportion of cities with a direct participation structure of civil society in urban planning and management that operate regularly and democratically

11.4.1 Total expenditure (public and private) per capita spent on the preservation, protection and conservation of all cultural and natural heritage, by type of heritage (cultural, natural, mixed and World Heritage Centre designation), level of government (national, regional and local/municipal), type of expenditure (operating expenditure/investment) and type of private funding (donations in kind, private non-profit sector and sponsorship)

11.5.1 Number of deaths, missing persons and directly affected persons attributed to disasters per 100,000 population

11.5.2 Direct economic loss in relation to global GDP, damage to critical infrastructure and number of disruptions to basic services, attributed to disasters

11.6.1 Proportion of urban solid waste regularly collected and with adequate final discharge out of total urban solid waste generated, by cities

11.6.2 Annual mean levels of fine particulate matter (e.g. PM2.5 and PM10) in cities (population weighted)

11.7.1 Average share of the built-up area of cities that is open space for public use for all, by sex, age and persons with disabilities

11.7.2 Proportion of persons victim of physical or sexual harassment, by sex, age, disability status and place of occurrence, in the previous 12 months

11.a.1 Proportion of population living in cities that implement urban and regional development plans integrating population projections and resource needs, by size of city

11.b.1 Number of countries that adopt and implement national disaster risk reduction strategies in line with the Sendai Framework for Disaster Risk Reduction 2015–2030

11.b.2 Proportion of local governments that adopt and implement local disaster risk reduction strategies in line with national disaster risk reduction strategies

11.c.1 Proportion of financial support to the least developed countries that is allocated to the construction and retrofitting of sustainable, resilient and resource-efficient buildings utilizing local materials

Ruolo protocolli di valutazione

Protocolli a scala edilizia e urbana supportano gli Obiettivi di Sviluppo Sostenibile.

Possibilità di stabilire obiettivi di prestazione misurabili e verificabili basati su indicatori quantitativi in leggi, regolamenti, programmi di finanziamento, ecc...

Supporto ai processi decisionali attraverso informazioni oggettive e credibili.

Strumento di riferimento per tutti i portatori di interesse. Definizione di edificio sostenibile.

SFIDE E PROBLEMI COMUNI

INCERTEZZA E CONFUSIONE

Perché protocolli armonizzati ?

- Stabilire un linguaggio comune
- Possibilità di misurare il progresso globale nei confronti degli obiettivi transnazionali
- Accordo in merito alla definizione di edificio sostenibile

- Trasferimento di buone pratiche
- Iniziative internazionali facilitate
- Possibili regolamenti e direttive comuni

SVILUPPO DI UN PROTOCOLLO

The Philip Merrill Environmental Center

Chesapeake Bay Foundation Annapolis, Maryland

- Building function type: Commercial office building
- Location: Annapolis, Maryland
- Completed: 2000
- Owner: Chesapeake Bay Foundation
www.savethebay.cbf.org
- Designers/architects: Smith Group
- Site area: 127,475 m²
- Gross floor area, m² (32,000 ft²) = 2,970 m²
- Typical building population: 100 people (100,000 members and volunteers visit)

Description:

A unique holistic design process produced the Chesapeake Foundation's new building. This award-winning, 35,000 ft² building serves as a global model of energy conservation and sustainable building techniques. The Center's primary purpose is to "save the Bay" through resource conservation and protection, environmental advocacy, and education, and this principle was extended to their new headquarters building, which uses less than one-third less energy than a typical office building of the same size.

Energy efficiency features include natural ventilation, which takes advantage of the Bay's breezes to cool the building without relying completely on air conditioning. When sensors determine that the outdoor climate is suitable, the mechanical system shuts down, motor-operated windows open, and "openwindow" signs signal employees to open their windows. Active solar features produce a portion of the building's electricity using solar-electric panels. Solar water heating reduces electricity demand.

Trickleback connecting ledges reduce resident ventilation from human waste and roofing systems capture rainwater for hand-washing and fire suppression. Smart parking design reduces fossil fuel consumption. The building is designed under the parking on water rain structure award. Greenhouse and water

Selected Environmental Sustainability Indicators for the Design		pts of 100 only
ES1-1	Total net consumption of primary embodied energy, GJ	3.2
ES1-2	Net annualized consumption of primary embodied energy, MJ	65
ES1-3	Net annual consumption of primary energy for building operations, MJ	490
ES1-4	Net annual consumption of primary non-renewable energy for building operations, MJ	184
ES1-5	Net annualized primary embodied energy and annual operating primary energy, MJ	600
ES1-6	Net area of land consumed for building and related works, m ²	2.6
ES1-7	Net annual consumption of potable water for building operations, m ³	1
ES1-8	Percentage of grey water and sewerage for building operations, %	8
ES1-9	Net annual GHG emissions from building operations, by CO ₂ equivalent	98
ES1-10	Product GWP100 equivalent building per year per ton	0.002140
ES1-11	Total weight of materials removed in design from on-site or off-site uses, kg	720
ES1-12	Total weight of new materials added to design from off-site uses, kg	951

Note: Score level on the left-hand side indicates the benchmark level of performance, on performance displayed to the right is a minimum for a 100.

U.S. Team GREEN BUILDING CHALLENGE 2002

CENTRE DE LOISIRS ROUGET DE LISLE - NANTERRE Leisure Center in Nanterre

Owner: Ville de Nanterre
Architect: Atelier d'Architecture Philippe Madec
Energy design: INGEROP
Environmental expert: TRIBU

Annual operating final energy consumption: 103 kWh/m² year
Annual consumption of potable water: 44 m³/j (including collected rain water)

Integration into the local environment

- Compromise between the hard constraints of the site (south façade close to railway) and a good comfort level for users (visual, acoustics...)
- Priority to pedestrian paths

Structure, products and materials

- Choice of durable, and easy-to-repair and easy-to-clean materials
- Choice of materials with low impact on human health

Energy consumption

- Ventilation system with heat recovery
- Low NOx emissions gas boilers
- Building Energy Management System (in accordance with the outside temperature and the occupation)

Indoor environment

- Good quality of daylighting by large use of glazed façades and light well
- Ventilation system permitting accelerated flows during non-heating period

Environmental management

- Involvement of the maintenance staff in the studies and choices concerning vegetal species, floor coverings, systems and equipments (including T.BEMS)

Telecommunication and telematic university school in Baix de Llobregat, SPAIN

OVERVIEW

Owner: Universitat Politècnica de Catalunya
Location: Baix de Llobregat
Architects: Josep Sureda / Agusti Mateos
Collaboration: Manuel Argüello / Oriol Casadó
Clients of work: Josep Molas
Engineers: C.O.T. Ulla J. Duart, S.L.
Main contractor: NEDSO, S.A.
Year of completion: 2001
Gross Floor Area: 11275 m²
Construction cost: 10.700.000 €

DESCRIPTION

Programatic needs, leading about the building and its location in the site, sums up the following characteristics:
- allow thematic diversities;
- factors connected with the total sanitary water supply system;
- the toilets. The water table supplies;
- water cells, installed in southern the walls. These produce hot water from the heating system;
- sunshade poles under flooring. The 5, equipped to the base and of floor microclimate in the toilet's rooms, walls in the roof

THE LIVING EXPERIENCE OF HONG KONG

GREEN BUILDING CHALLENGE

The Philip Merrill Environmental Center

Chesapeake Bay Foundation
Annapolis, Maryland

- Building function type:
Commercial office building
- Location: Annapolis, Maryland
- Completed: 2000
- Owner: Chesapeake Bay Foundation
www.savethebay.cbf.org
- Designers/architects: Smith Group
- Site area: 127,475 m²
- Gross floor area, m² (32,000 ft² = 2,970 m²)
- Typical building population: 100 people
(100,000 members and volunteers visit)

Description: A unique holistic design process produced the Chesapeake Foundation's new building. This award-winning, 31,000 ft² building serves as a global model of energy conservation and sustainable building techniques. The Center's primary purpose is to "Save the Bay" through resource restoration and protection, environmental advocacy, and education, and this principle was extended to their new headquarters building, which uses two-thirds less energy than a typical office building of the same size.

Energy efficiency features include natural ventilation, which takes advantage of the Bay's breezes to cool the building without relying completely on air conditioning. When sensors determine that the outdoor climate is suitable, the mechanical system shuts down, motor-operated windows open, and "openwindow" signs signal employees to open their windows. Active solar features produce a portion of the building's electricity using solar-electric panels. Solar water-heating reduces electricity demand.

Flushless composting toilets reduce nutrient pollution from human waste and rooftop cisterns capture rainwater for hand washing and fire suppression. Smart parking design reduces harmful runoff from surfaces by placing parking under the building and using gravel surfacing for parking outside the building. Remaining storm-water runoff flows through a bioretention storm-water treatment system designed to treat oils and then through a constructed wetland. Geothermal heat pumps are used for heating and cooling the building.

Selected Environmental Sustainability Indicators for the Design		per m ² only	by area & by occupancy
ES1-1	Total net consumption of primary embodied energy, GJ	3.2	31.5 (MWh/1000m ²)
ES1-2	Net annualized consumption of primary embodied energy, MJ	65	631 (MWh/1000m ²)
ES1-3	Net annual consumption of primary energy for building operations, MJ	690	5823 (MWh/1000m ²)
ES1-4	Net annual consumption of primary non-renewable energy for building operations, MJ	684	5864 (MWh/1000m ²)
ES1-5	Net annualized primary embodied energy and annual operating primary energy, MJ	689	6495 (MWh/1000m ²)

Clarks of work:	J. Cornell / J. Balboa
Year of completion:	1.990
Project Financing:	Thematic project from the European Community
Main contractor:	ACB Proyectos, Obras y Construcciones, S.A.
Building type:	Multi-residential
Gross Floor Area:	11.600 m ²

VIEW OF THE BUILDING

URBAN CONTEXT OF SABADELL

DESCRIPTION

The project is aimed as a direct application and integration of energy and environmental efficient aspects, to be easily integrated in a normalized way into the social housing buildings.

The design approach:

- a) Block building type with a good thermal behaviour due to a shape optimization
- b) Double-sided ventilation in all the dwellings
- c) Dimensioning of the openings for solar gain in winter, combined with high inertial floors.
- d) Glazed areas with insulated fenestration
- e) The openings in the south are protected with overhang in summer.

- f) Roller blinds with orientable louvers, that allow the gradation of the sun light entering
- g) Due to the orientation of the site, design of the envelope depending on the facade.

- h) Envelope with double skin ventilated, avoiding the excessive warming in summer.

- Facades, made of 30x30cm ceramic tiles hanged, with a air chamber open to the exterior.
- Ventilated roof, with floating flooring with adjustable bearings

VIEW OF THE BUILDING

ENVIRONMENTAL CONSIDERATION

ENERGY

- Construction energy saving
 - Local material suppliers
 - Optimization of the constructive systems
 - Choice of materials with a low carbon footprint

MATERIALS

- Non PVC for drain systems
- Use of ecologic materials, recycled, re-used, non-pollutant and harmless

INDOOR QUALITY CONTROL

- Home automation, with controls for heating and gas leakage detection

WATER

- Use of sanitary systems with low consumption
- Toilet with flush stop

BEST PRACTICES

- Installation of separate waste containers
- Bicycle parking for each owner

SPAGNA

EDIFICI RESIDENZIALI

FUNCAMP Complex, Campinas, Brazil

Mostly local materials were used. Parking areas are asphalted and landscaped area is covered with grass that requires watering. No greywater system is available. Rainwater collected by buildings pipes goes to the lake. The lake water, on its turn, is used for irrigation.

Overview

Funcamp Complex is in Campinas, Brazil, around 90 Km northwest of the city of São Paulo. The site share limits with a farm, the campus and a lake surrounded by a small ecological park. Only 30% of the total 121.000 m² of FUNCAMP's site may be built. The office and hotel blocks were inaugurated in 1996, using a terrain parcel of 21.000 m². Design of new blocks is on the way and includes a convention center and a second hotel block, supposed to be "greener" than the existing complex.

The hotel and office buildings sum up to 4.420 m² (gross floor area), distributed in two floors at each block. The 45 apartments of the hotel are mainly occupied by guest professors visiting the campus or by delegates attending the frequent conferences held either at the hotel itself or at the University's convention center. The amenity area includes swimming pool, sauna, sports courts and a link to the ecological park nearby. This example, though not revolutionary, explores the potential for daylighting and natural ventilation

BRASILE
UNIVERSITA'

02 <http://ilsbe.org>

At both buildings, spaces are inundated by abundant daylight coming through large windows and the upper portion of atria. Windows exposed to intense light received a combination of external shading devices and films to prevent glare. Only workspaces, apartments and auditoriums have artificial air conditioning (window or split units), what represents 69% of the building gross floor area. No space heating is used. A small parcel of renewable energy is used to provide water heating for the hotel apartments and restaurant and external illumination (PV cells). The net ecological value of the site is expected to be not significantly different from the predevelopment condition. The site was previously unbuilt. No significant vegetation was removed and the small earth movement was accommodated within site limits.

ISAPRE CONSALUD is a health insurance and services company that belongs to the Chilean Chamber of Construction. They required a new headquarters to project their own corporate image.

CILE
CENTRO DIREZIONALE

2.- Relevant Architectural an Building Aspects

2.1 Architecture

a) SOLAR ORIENTATION

The main façade is exposed to the northern sun, optimizing the exposure in winter. The main building axis is east-west.

b) SHADING

A sun shade 6.10 m wide was placed in the upper part of the north façade, reducing the summer sunshine into the glassed area. At ground level, plant pots and reflecting pools with water cascades moderate temperature.

c) BUILDING ZONES

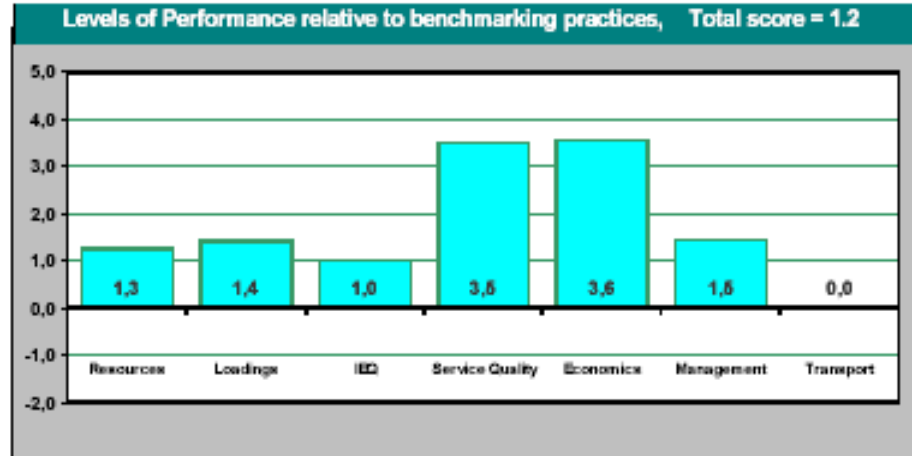

There are three distinct zones:
 a) Office area, with a geo-climatic system, b) Support area that can function autonomously, with cafeteria, conference room and five meeting rooms, c) Recreation & sport area, with gymnasium, squash, multipurpose room, and outdoor recreational facilities.

d) NATURAL LIGHTING – OFFICE AREA

With a volume relatively narrow and an open floor plan, it gets natural light from the two main sides, eliminating dark interior spaces, thus reducing energy consumption.

e) OPEN FLOOR PLANS

Related with above and a mechanical floor, it allows maximum flexibility.

BRIEF ASSESSMENT NOTES

Brief thinking was not carried out against the other campus buildings but against typical practice for tertiary buildings in 2002.

Workshops were not limited by sweeping 11.8m clear substructure building heights and keeping with the Australian Heritage Places.

Due to lack of available information the functions and Pre-Operational Ma's general categories were not assessed.

The building for which was considered to be fairly good at minimum was not at a level of 1200. This includes Brisbane.

EE energy simulator software incorporating weather data for Brisbane was used.

THE LIVING EXPERIENCE OF HONG KONG

INTRODUCTION

Hong Kong, 'Pearl of the Orient', lies on the southern margin of the Pearl River. The region comprises the peninsula of Kowloon and the New Territories, with a coastline 344 km long, and is made up of 223 outlying islands, of which the largest is Lantau Island and the second largest is Hong Kong Island. The watershed is rugged, with several high peaks, which include the two main ridges, Lantau Peak (957m) and Sulphur Peak (937m). There are only comparatively limited parts of the land.

The total area of the region is 2,639 km², of which comprises 1,370 km² of built area. This represents about 40% of the total area and 9% of which is occupied by C. At the remaining 40% area (1,039 km²) is covered by sea.

According to the land area statistics 2000, within the built area, there are only 27.7% used for urban and building purposes, as other lands are considered such as land, grassland, or agricultural uses.

It is interesting to point out that Hong Kong, besides having the image of being an international metropolis, has plenty of green land to grow its own healthy 'food'. There are 211 country parks, which covered over 400 km² that means 40% of built area of Hong Kong is covered by greenery. Comparing with other cities, less than half (2%) of these land possesses the same lush, beautiful landscape like the parks when they are traveling to Hong Kong.

A-6922 Wolfurt/Vorarlberg

GBC-assessed project

The passive house Wolfurt is multi-unit residential building in a village in Vorarlberg, the most western province of Austria. The building was planned and constructed in the course of the CEPHEUS project, supported by the European Commission.

All CEPHEUS buildings have to meet very high energy requirements according to the passive house standard - for heating ener-

Building type

multi-unit residential building consisting of two identical houses, each of them with 4 apartments and two ateliers

Completed: 1999

Site area: 2,730 m²

Building land: 501 m²

Usable area for dwelling units: 1,204 m²

Share of dwelling units / of ateliers: 91% / 9%

NEC Tamagawa Renaissance City

Photo by Taisei Group

NEC Tamagawa Renaissance City was built as a redevelopment of part of NEC's Tamagawa site, as a project to mark the company's centennial. The South Tower, completed in January 2000, was followed by North Tower and the Hall. The developer went beyond calling for environmental consideration in the building, demanding construction of an "Eco Building", affecting all aspects down to the daily activities of the designers and builders.

■ Building Outline

Building name: NEC Tamagawa Renaissance City
Building type: Office and Hall
Location: Matsubara-ku, Kawasaki city,
 Kanagawa prefecture
Completion: March, 2000
Owner: NEC Facilities, Ltd.
Architect: Nikken Sekkei Ltd., Obayashi Corporation
Contractor: JF of Obayashi Corporation and
 Kajima Corporation
Site area: 14,810sqm
Gross floor area: 187,360sqm
Structure: SRC and RC
Number of floor: -2, 126 (South Tower)
 -1, 127 (North Tower)
 12 (Hall)
Occupancy: 13,000persons

Fig. 2. Assessment result by GBTec2000

■ Measures taken to maintain Environmental Quality (Q-1) Indoor environment

- Provide smoking rooms, control the air exhaust volume using automatic exhaust.

Q-2 Quality of Service

- Use of Y-type elevator system for emergency rescues
- Use of air resistance flow for exterior wall for improved acoustic stability and maintenance
- Specify low lead and chlorine at 2-in lead capacity.
- Specify mainframe network nodes, integrated network for piping, and other suitable spaces for equipment installation.

Q-3 Outdoor Environment on Site

- Landscaping of public facilities as a green environment
- Setting up open spaces (2/3 of site plan) into a "landscape of

■ Measures taken to maintain Environmental Loads (L1-1) Energy

- Steer the building is oriented in the East-West direction, provide protection from western sunlight and make use of natural light.
- Use of an outdoor air-cooling / free-cooling system and air-flow windows on north and south facades.
- Use of UV and WW control.
- Introduce high-efficiency refrigerator system, a re-generation system and a heat storage system.
- Use of a high-voltage distribution system, and reduction of transformer loss using power-factor-improving high-voltage capacitors (extra-high-voltage transformer room) and high-voltage extra-high-voltage transformers.
- Use of high efficiency lighting fixture controlled by daylight sensors.
- Improve EMS, build up a general monitor system and use automatic air-conditioning control systems using EMS-net.

LR-2 Resources & Materials

- Design with consideration of recycle
- Use of spray water by means of filters drainage treatment, wastewater treatment and cooling tower water treatment facilities.
- Use of blast furnace cement for underground structure
- Reduce emission and underground volume by placing the parking of ground level.

LR-3 Off-site Environment

- Use of solar permeable waterproof pavement

GIAPPONE
CENTRI DIREZIONALI

ARCHITECTURAL PRESENTATION OF MUTUALPARK

Only the four buildings; Mutual-81, Mutual-89, Mutual-91 and Mutual-94 were assessed. These buildings are independent and are only connected via hallways, except for Mutual-89 and Mutual-91. These two buildings are connected to each other by an atrium.

All the buildings are mainly of the open plan office layout. The ceilings are a suspended wooden grid, about 0.75 m from the roof floor. All the supply and return air ducting, electric and networking cabling are routed in this "plenum". The floor is a pre-cast concrete waffle structure finished off with screed and carpet. The overall U_f-value of all the floors are 2.26 W/m²·K.

Roof construction:

	Mutual-89 & Mutual-91	Mutual-81 & Mutual-94
Outer layer:	Stones and Durby gum of 20 mm	Zinc metal of 1.5 mm
Inner layers:	Screed of 35 mm	Cellulose fill in foil of 50 mm Air space of 300 mm Screed of 35 mm
Interior:	Waffle concrete structure of average 260 mm	Waffle concrete structure average 260 mm
Atrium to roof ratio:	8%	0%
Atrium window U-value	5.8 W/m ² ·K	
Overall U _f -value	2.5 W/m ² ·K	0.18 W/m ² ·K

Mutualpark, South Africa

Wall construction:

	Mutual-89	Mutual-89 & Mutual-91	Mutual-94
Outer layer:	Glass curtain of 6 mm	Granite slab of 30 mm	Granite slab of 30 mm
Inner layer:	Framework for glass curtain of 30 mm	Aluminium substructure of 110 mm	Aluminium substructure of 110 mm
	Cement bricks of 230 mm	Common brick of 110 mm	Common brick of 110 mm
Interior:	Plaster of 25 mm	Plaster of 30 mm	Plaster of 30 mm
	Paint	Strip wood covering of 3 mm	Strip wood covering of 3 mm
Window-wall area ratio	16.9%	34.9%	23.8%
Window U _f value	5.8 W/m ² ·K	5.8 W/m ² ·K	5.8 W/m ² ·K
Overall U _f -value	1.47 W/m ² ·K	1.97 W/m ² ·K	1.42 W/m ² ·K

Building models:

Shown below are the building models used during the SAEDES Evaluation of the buildings' energy consumption (the scale of the figures is not the same).

GBC ASSESSMENT RESULTS AND CONCLUSIONS

The following results were obtained from the assessment:

Environmental Sustainability Indicators for Design	by area only	area & occup.
Net annual consumption of primary energy for building operations in MJ, normalised for net area and occupancy	2745	172
Net area of land consumed for building and related works, normalised for net area and occupancy	0.18	2.58
Net annual consumption of potable water for building operations, normalised for net area and occupancy	5.8	2.5
Net annual GHG emissions from building operations, (kg CO ₂ equiv., normalised for net area and occupancy)	1241	78

Resource Consumption

Mutualpark has to improve their energy consumption by roughly 20% before meeting the standard. Facilities management has developed strategies to improve and maybe even excel the standard for energy consumption. Land consumption exceeds the standard whereas water and materials consumption is basically on standard.

Indoor environmental quality

Mutualpark evaluates fairly well in this section. Roughly 75% of the occupants are satisfied with the indoor environmental quality (IEQ). This is very good considering the great cultural and racial diversity of the occupants that makes the choice of a certain level of IEQ very difficult.

Environmental loadings

Most of the evaluation proofs Mutualpark to be below standard. This is mainly due to the low evaluation of the energy consumption. Improving the energy consumption should improve the environmental loading evaluation.

Quality of service

Mutualpark are really trying to improve their service to their workers as well as improving the working environment. This effort is reflected in the positive evaluation of the quality of service.

Overall evaluation:

The evaluation showed that the energy consumption and environmental loadings are below standard. However, from a facilities management point of view, it could be argued that the indoor environmental quality is over-performing and this is the reason the why the energy consumption is too high.

If the indoor environmental quality is reduced according to practice, the energy consumption should become closer to the levels required by the standards. Along with the lowered energy consumption an improvement in environmental loading should also be experienced.

SUSTAINABILITY KEY PERFORMANCE INDICATORS

CODE	CRITERION	INDICATOR	VALUE	UNIT	PERFORMANCE
A 1.7	Conservation of land	Area of undeveloped land with ecological or agricultural value / area of the neighbourhood		%	72%
B 3.3	Use stage energy cost for public buildings	Aggregated annual operating energy cost per aggregated indoor useful floor area		Euro/m ² /year	68%
C 1.1	Total final thermal energy consumption for building operations	Aggregated annual total final thermal energy consumption per aggregated indoor useful floor area		kWh/m ² /year	80%
C 1.4	Total final electric energy consumption for building operations	Aggregated annual total final electric energy consumption per aggregated indoor useful floor area		kWh/m ² /year	65%
C 1.7	Total primary energy demand for building operations	Aggregated annual total primary energy consumption per aggregated indoor useful floor area		kWh/m ² /year	72%
C 2.1	Share of renewable energy on-site, relative to total final thermal energy consumption for building operations	Annual total thermal energy from on-site renewables / total final thermal energy consumption		%	65%
C 2.7	Share of renewable energy on-site, on final electric energy consumptions	Share of renewables in final electricity consumption		%	80%
D 1.2	Total GHG Emissions from primary energy used in building operations	CO ₂ equivalent GHG emissions from internal floor area		kg CO ₂ eq./m ² /yr	83%
E 1.6	Consumption of potable water for residential population	Annual potable water consumption per occupant		m ³ /occupant/year	72%
E 1.7	Consumption of potable water for public non-residential building systems	Annual water consumption per m ²		m ³ /m ²	98%
F 1.3	Recharge of groundwater through permeable paving or landscaping	Area of permeable surfaces on total neighbourhood area		%	80%
F 2.3	Ambient air quality with respect to particulates <10 µm (PM10) over a one-year period	Number of days exceeding the daily limits in a year		Days/year	35%
G 2.1	Public transport services	Percentage of inhabitants that are within 400 meters walking distance of at least one public transportation service stop		%	80%
G 2.4	Quality of pedestrian and bicycle network	Total walkway meters of dedicated pedestrian paths and meters of bicycle path and "shared space" per 100 inhabitants.		m/100 inhabitants	85%
G 4.2	Availability and proximity of key services	Percentage of inhabitants that are within 800 meters walking distance of at least 3 key services.		%	72%
G 6.3	Community Involvement in urban planning activities	Level of involvement of users in urban planning		LEVEL (score)	68%

Conclusioni

L'origine del Protocollo ITACA e quindi della UNI/PdR 13 è **internazionale**

La PdR13 è parte dell'iniziativa **CESBA** e collabora con altri sistemi di valutazione europei di livello istituzionale

La PdR 13 sarà parte del sistema **Level(s)** integrando gli indicatori della Commissione Europea e generando **certificati compatibili** con quelli di tutti i principali sistemi europei (DGNB, HQE, BREEAM, ecc.)

La PdR 13 è integrata nel consesso internazionale dei sistemi di valutazione e contribuisce alle **iniziative di armonizzazione** a livello Europeo e mondiale.

Grazie per la vostra attenzione
